The present application relates to a thyristor arrangement known from EP-A-0 301 761 with a main and an auxiliary thyristor and a protective resistor that connects the cathodes from the main and auxiliary thyristors together.

The invention addresses the problem of making good turn-off protection available. The auxiliary thyristor ensures that upon switching on, protection is provided from excessively high current. This is achieved in that the protective resistor falls from a relatively high to a relatively low value during the current carrying phase during turn on.

This solution of the problem is not suggested by the available prior art. Moreover, it sooner appears to be that a person skilled in the art would more likely choose equal or higher resistance in the current carrying phase to protect the auxiliary resistor.

The present invention is with certainty industrially applicable.
